

# Token Allocation

# 1. Token Allocation

There were 280,000,000 Numerico Tokens (NWC) initially created on the Stellar blockchain, and this is also the max token supply. The total supply will decrease, however, as a key component of the ecosystem is token burning, reducing the supply over time.

These tokens were allocated as follows:

The team wallet, apart from approximately 5 million tokens that were unlocked in the first few months of the project (i.e. the remaining 84,115,467 NWC) is locked until 1 January 2028, with the possibility of extending this lockup even further.

Reserve funds are kept if a need arises for more liquid assets (the community can decide on this later on through governance), and the Community development funds are allocated for the purpose of bootstrapping early marketing, community incentives, salaries for internal and external collaborators.

As for the Public Sale, the team decided to approach this in an innovative way. Rather than holding an ICO with a predetermined token price, this was done through the open market, allowing market participants to freely determine the project's valuation. More specifically, 30% of the supply was offered for sale through centralized exchanges in the first months after the listing, while an additional 20% was sold through OTC deals at different points in the early phase of the project. Overall, the average price at which these tokens were sold was \$0.02, meaning that the team raised \$2.8 million dollars in total.

Given the nature of the project's development (namely the high cost of initial development, before the project could gain enough users to become self-sufficient), this was supplanted to a large extent with funds provided by the founding members themselves. In fact, the earliest and most capital-intensive phases of development took place before the first listing and were thus completely self-funded. Rather than an implausibly high valuation raised in advance – as is often the case with standard ICOs – this process gave the team a very modest amount of funding only after the MVP was launched, while at the same time putting 50% of the supply in the hands of the community, linking the incentives of all participants in the ecosystem.

## 2. Cross-chain

NWC started out on the Stellar blockchain due to its very fast and cheap transactions. Eventually, the exponential growth of decentralized finance on other chains (particularly Ethereum and BSC) created the need for Numerico to go cross-chain and make the token available for use in these new protocols. Thus, a portion of the supply was bridged to Ethereum and BSC, while the majority of the supply (along with the token burning mechanism) remained on Stellar. The tokens can be swapped between the different chains in a 1:1:1 ratio at any time, and this feature is available on the official Numerico website.
